

Database Design

Project: Pizza Sales Business Analysis Using SQL

Database Name

taranovas_pizza

Database Overview

The database is designed using a relational model consisting of four interconnected tables. Each table stores a specific type of information related to pizza sales, enabling efficient querying and business analysis.

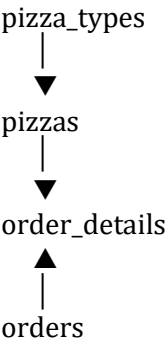

Tables and Primary Keys

Table	Primary Key
orders	order_id
order_details	order_details_id
pizzas	pizza_id
pizza_types	pizza_type_id

Relationships

- orders.order_id → order_details.order_id
- pizza_types.pizza_type_id → pizzas.pizza_type_id
- pizzas.pizza_id → order_details.pizza_id

Relationship Diagram

Design Benefits

- Reduces data redundancy through normalization.
- Maintains data integrity using primary and foreign keys.
- Supports efficient joins and business reporting.
- Provides a scalable structure for future enhancements.
